Discussion (1)

Tier 1 tools and exposure prediction

- Based on external validation and other work under the project, where do you see main needs for improving the tools themselves in order to:

    - ensure the level of conservatism expected for a Tier 1 tool and

    - to cover frequently occurring exposure situation and/or substance/product properties which fall out of the applicability domains of the current Tier 1 tools.

- What could be concretely done on the tools themselves in the next 1-2 years, and what will be subject to a longer term process?

Discussion (2)

Qualification and skills of tool users

➔ What is in your view needed to enable the tool users to generate reliable exposure estimates?
  ➔ improved user interfaces?
  ➔ guidance?
  ➔ training?
  ➔ quality assurance programs?

➔ Who are in your view the main users of the tools under REACH and the Arbowet?
