# NVvA/BOHS initiative

Draft 26 Sept 09

[www.bohs.org](http://www.bohs.org):

31 oct 09

## Testing Compliance with Occupational Exposure Limits

### CONSULTATION

This is draft guidance produced by a joint Working Party of the British Occupational Hygiene Society and Nederlandse Vereniging voor Arbeidshygiëne (the Dutch Occupational Hygiene Society). It is made available for trial and comment, but no liability is accepted by either organisation in connection with its use. Comments should be sent to [nvva@arbeidshygiene.nl](mailto:nvva@arbeidshygiene.nl) by 31 December 2009. Comments based on practical workplace trial are particularly welcome.

# Agenda

- Introduction
  - Goal of the NVvA BOHS initiative
  - existing exposure assessment documents
  - Content
  - Approach
- Improvements on the current approach:
  - Between and within worker variance
  - Undetectables
  - Unbiased estimators in small sample series

# Goal of the NVvA/BOHS document

Trevor Ogden wrote (100317):

BOHS/NVvA request : “to develop practical guidance for their members and others. The document should focus on measurement strategies for compliance with occupational exposure limits (OELs) for chemical agents with acute and/or chronic health effects. “

- What is the additional value of the new document compared the existing documents/standards?

# Why a new NVvA/BOHS document?

Some existing exposure assessment documents  
with a focus on the Netherlands and the EU

# Enforcement instruction Labor Inspectorate

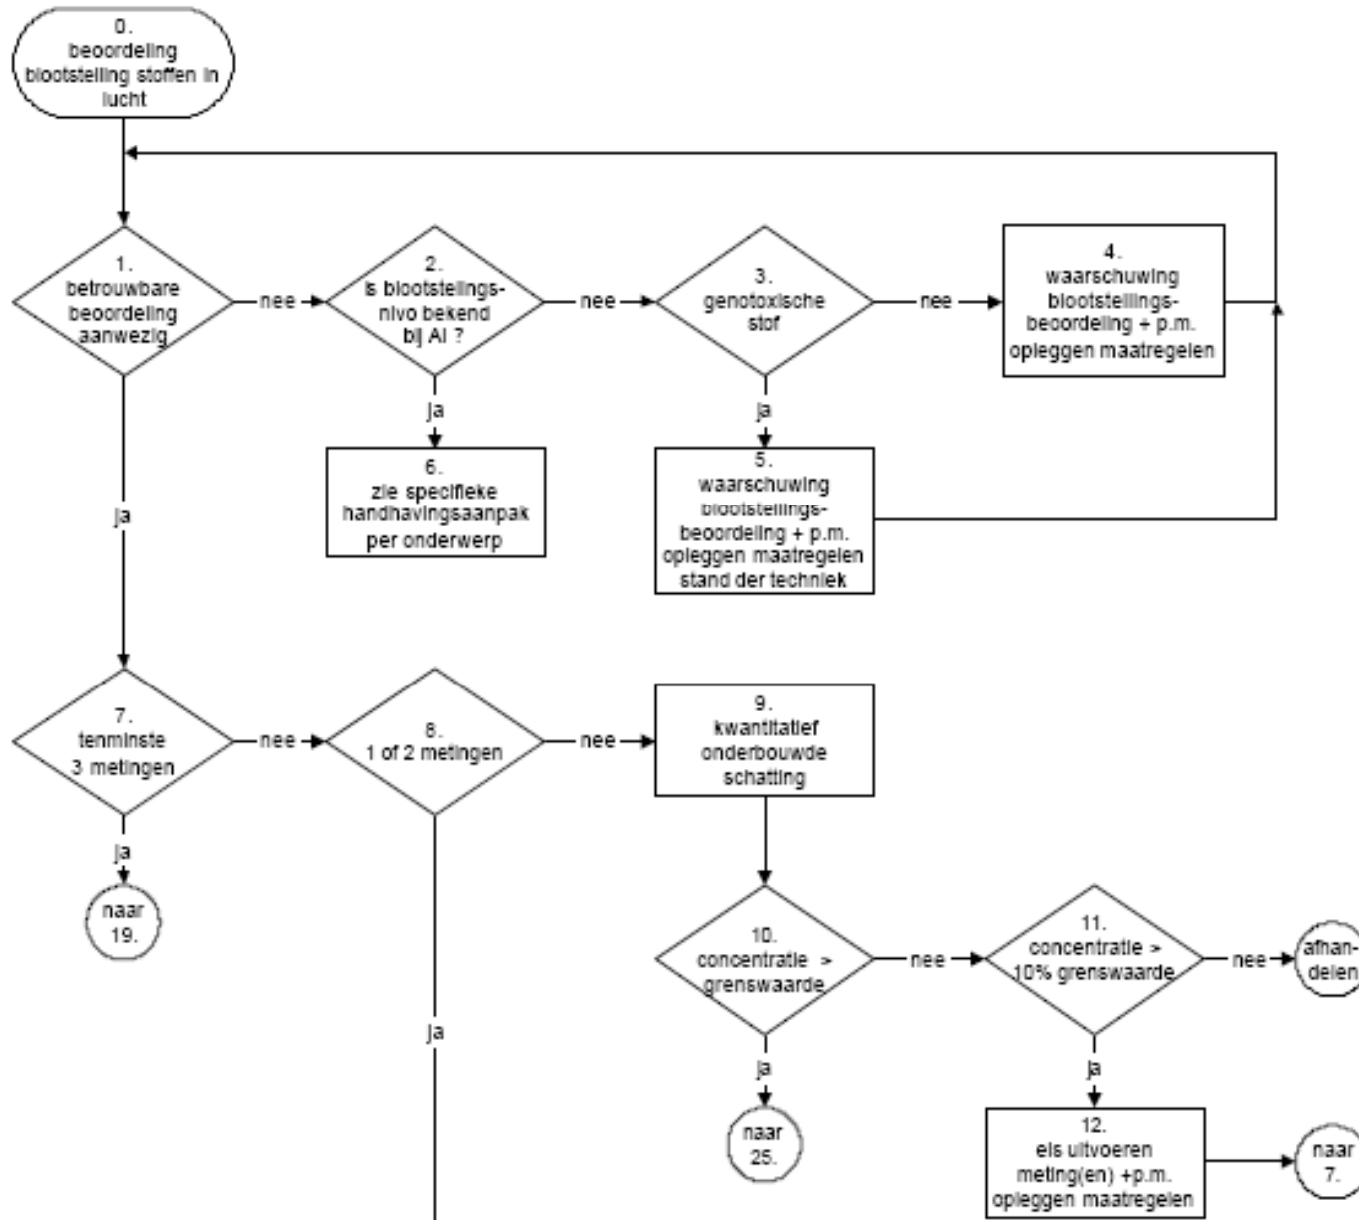

## *Interne instructie Arbeidsinspectie*

Beoordeling van de blootstelling  
aan gevaarlijke stoffen  
en het  
toetsen van de meetresultaten aan  
luchtgrensgrenswaarden

### INHOUDSOPGAVE

#### 1. INLEIDING

# EU/ CEN 689 Sampling Strategy: outdated since 2005

## Quantitative assessment

- Chapters 5.2 through 6
- Eight annexes A - G (informative, not part of the standard)

EUROPEAN STANDARD

EN 689

NORME EUROPÉENNE

EUROPÄISCHE NORM

February 1995

ICS 13.040.30

Descriptors: Air, quality, air pollution, workplace, exposure, contaminants, chemical compounds, estimation, maximum value, measurements, accident prevention

English version

**Workplace atmospheres - Guidance for the assessment of exposure by inhalation to chemical agents for comparison with limit values and measurement strategy**

Atmosphères des lieux de travail - Conseils pour l'évaluation de l'exposition aux agents chimiques aux fins de comparaison avec des valeurs limites et stratégie de mesurage

Arbeitsplatzatmosphäre - Anleitung zur Ermittlung der inhalativen Exposition gegenüber chemischen Stoffen zum Vergleich mit Grenzwerten und Meßstrategie

This European Standard was approved by CEN on 1995-02-17. CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

The European Standards exist in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

# EU Chemicals at work directive 98/24

Dok. 2261-00-00-EN final

## PRACTICAL GUIDELINES

OF A NON-BINDING NATURE ON THE PROTECTION OF THE HEALTH AND SAFETY OF  
WORKERS FROM THE RISKS RELATED TO CHEMICAL AGENTS AT WORK

(Articles 3, 4, 5 and 6, and Annex II, section 1, of Directive 98/24/EC)

**ANNEX 2:** Simplified risk assessment methodologies

**ANNEX 3:** Application examples of the principles for prevention and specific measures in two industrial processes

**ANNEX 4:** Quantitative evaluation of exposure to chemical agents

**ANNEX 5:** Measurement methods for chemical agents in the list of indicative limit values in Directive 2000/39/EC

## Guidance on information requirements and chemical safety assessment

### Chapter R.14: Occupational Exposure Estimation

**December 2009**  
(version 2 Rev.:1.1)

Guidance for the implementation of REACH

## Guidance on information requirements and chemical safety assessment

### Chapter R.13: Risk management measures and operational conditions

**May 2008**  
(version 1.1)

Guidance for the implementation of REACH

# Content of the current BOHS/NVvA draft

## Testing compliance with OEL

- Chapter 1. Conducting a survey for exposure evaluation
- Chapter 2. The problem of variability
- Chapter 3. Recommended method of measuring compliance
- Chapter 4. Shortcuts and their limitations.
- Appendix 1. Reminder of statistical concepts
- Appendix 2. Calculating between-worker and between-shift variances and group and individual exceedances

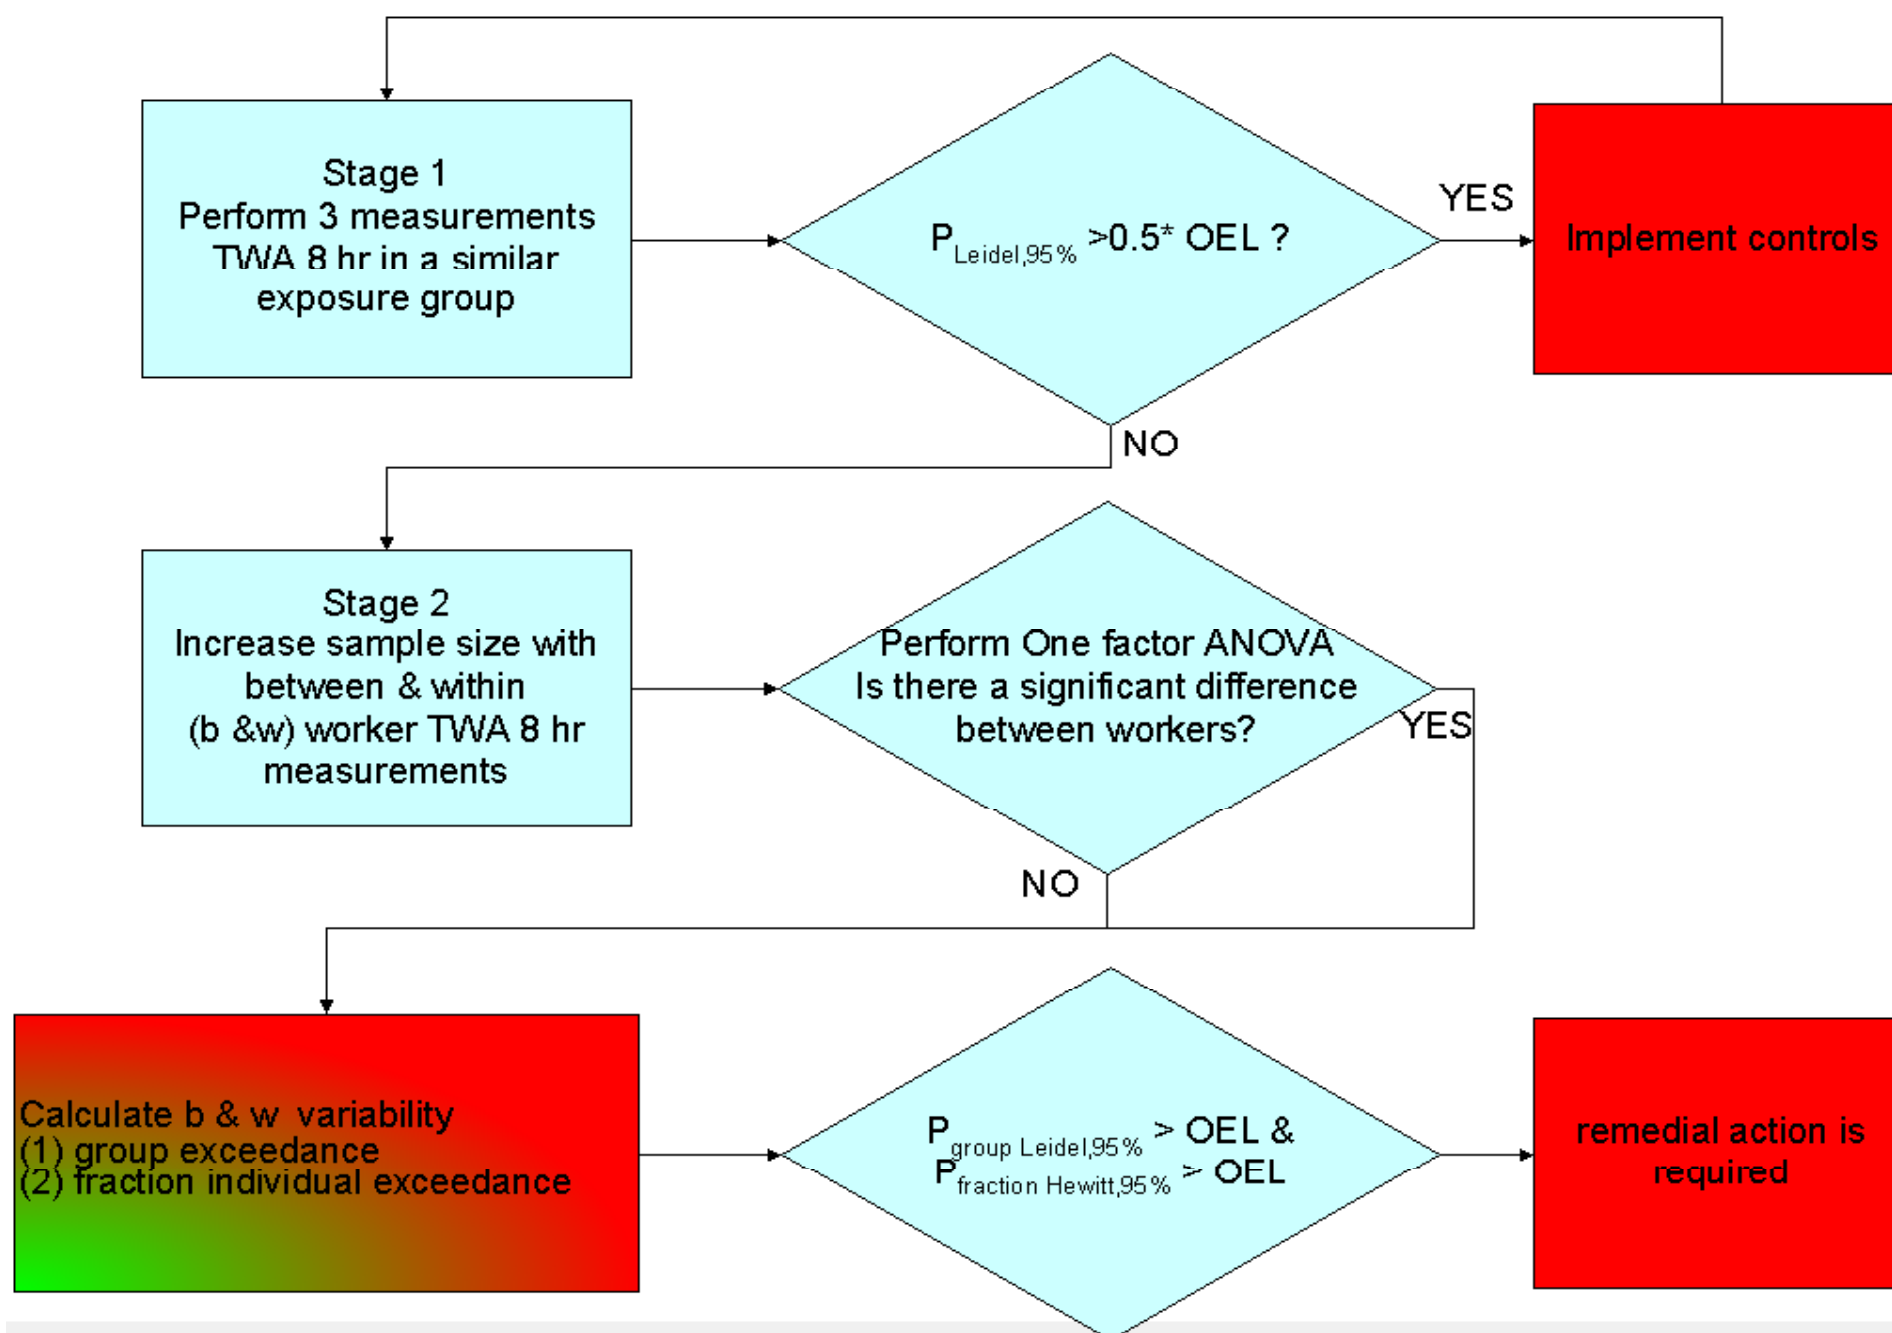

## Ch. 3 Recommended method of testing compliance

- Stage 1. Three representative samples are taken and their maximum likelihood 95th percentile is compared with half the occupational exposure limit.
- Stage 2. A full monitoring program is used to estimate the within-worker and between-worker variations, and to use these to estimate
  - (1) the percentage of exposures of the whole SEG which would lie above the OEL, and
  - (2) the percentage of the measured workers that would have more than 5% of their exposures above the OEL.

Proposed NVvA BOHS scheme for compliance testing with measurements (Draft Oct 2009)

# Implicit goals of the NVvA/BOHS document

- To provide enterprises, industrial hygienists and law enforcers in Europe an updated and improved standard in compliance testing now CEN 689 (1995) is more than 10 years old and outdated.
- To gain acceptance for the stage 2 compliance testing of group and individual exceedance, using the within- and between-worker variances.
- A link to REACH ART (mentioned yesterday)

# Improvements for stage 1

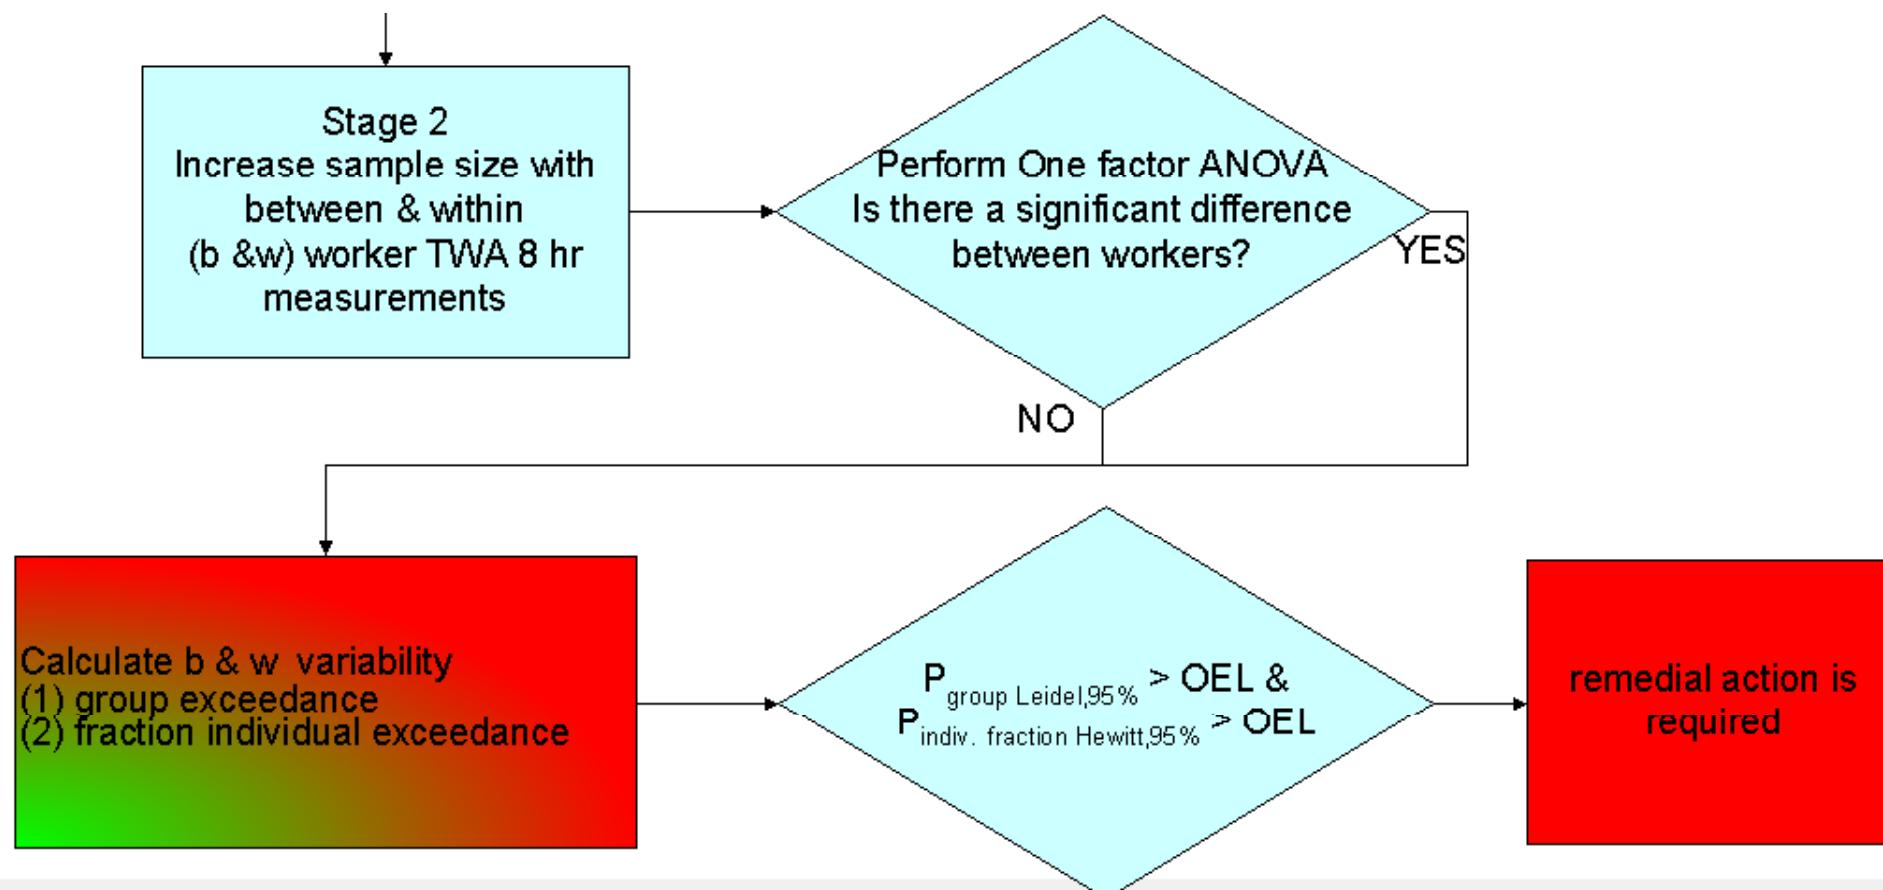

Proposed NVvA BOHS scheme for compliance testing with measurements (Draft Oct 2009)

- Include qualitative (RMM, OC) and semi quantitative (modeling, surrogate, historical) decision tree (Stage 0) to exclude obvious compliance, to prevent unnecessary measurements and to focus on worst case SEG.
- N=3 measurements is arbitrary/small
- Introduce a stage 1 compliance level ( $0,1 * OEL?$ )
- $P_{Leidel,95\%} > 0.5 * OEL$ : a biased and primitive statistic.
- $P_{Wilks,95\%} > OEL$ : an unbiased compliance statistic for every N.

# Stage 2 exposure assessment

# Historical context stage 2 individual testing

- 1981: Every worker is unique! OH-Physician view
- 1985: Introduction HEG/SEG concept in many chemical companies
- 1993: Workers exposure differ in SEGs. (Rappaport/Kromhout).
- Dispute 1995 American Industrial Hygiene Association J.

SEG's with BW ratio > 2 and their confidence interval!

# Historical context stage 2 individual testing

- Rappaport/Kromhout: 85% of SEG have BW ratio  $>2$  .
- Scheffers/Rappaport : 15-30% significant BW ratio  $>1$
- Scheffers: an additional 5% significant BW due to change.

## Conclusion:

Workers exposure within a SEG may or may not origin from the same exposure distribution.

Test if individuals deviate using single factor ANOVA, before running BW models

T8

fx 
$$=(\text{LN}(T4)-(T23+1.645*T21))/T17$$

ROYAL HASKONING

22% chance that all individuals have the same exposure distribution

## Comments on current stage 2

- Is not included to test if workers exposure origin from the same distributions.
- Crippled handling of undetectables, cause decrease of variability in lower side workers
- No need to test group compliance, because individual fraction is always more conservative.
- Small sample size per worker is calculated using Maximum Likelihood in stead of unbiased techniques, causing underestimation of risk.

# Ethical issue in stage 2 testing

Due to chance:

- two workers in one SEG with  $GSD > 2,5$  two workers can easily differ in GMs with a factor 2 based on 6 measurements
- Small sample, individual measurements may stigmatize workers as “dirty”

## Stage 2 algorithms for group and individual exceedance

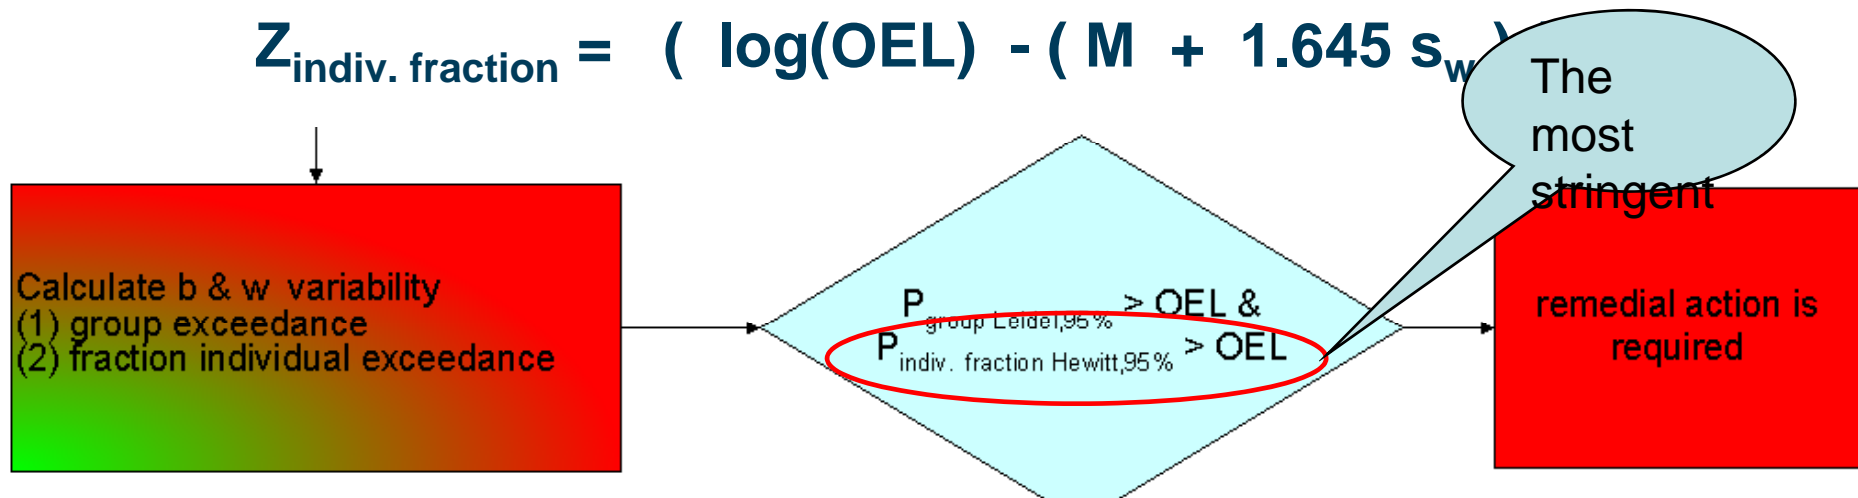

- the group exceedance: the fraction of all exposures of the whole SEG which exceed the OEL:

$$Z_{\text{group,Leidel}} = ( \log(\text{OEL}) - M ) / s$$

the individual exceedance: the fraction of all the workers in the SEG who have 95th percentiles of exposure exceeding the OEL.

$$Z_{\text{indiv. fraction}} = ( \log(\text{OEL}) - ( M + 1.645 s_w )$$

## Stage 2 algorithms for group and individual exceedance (2)

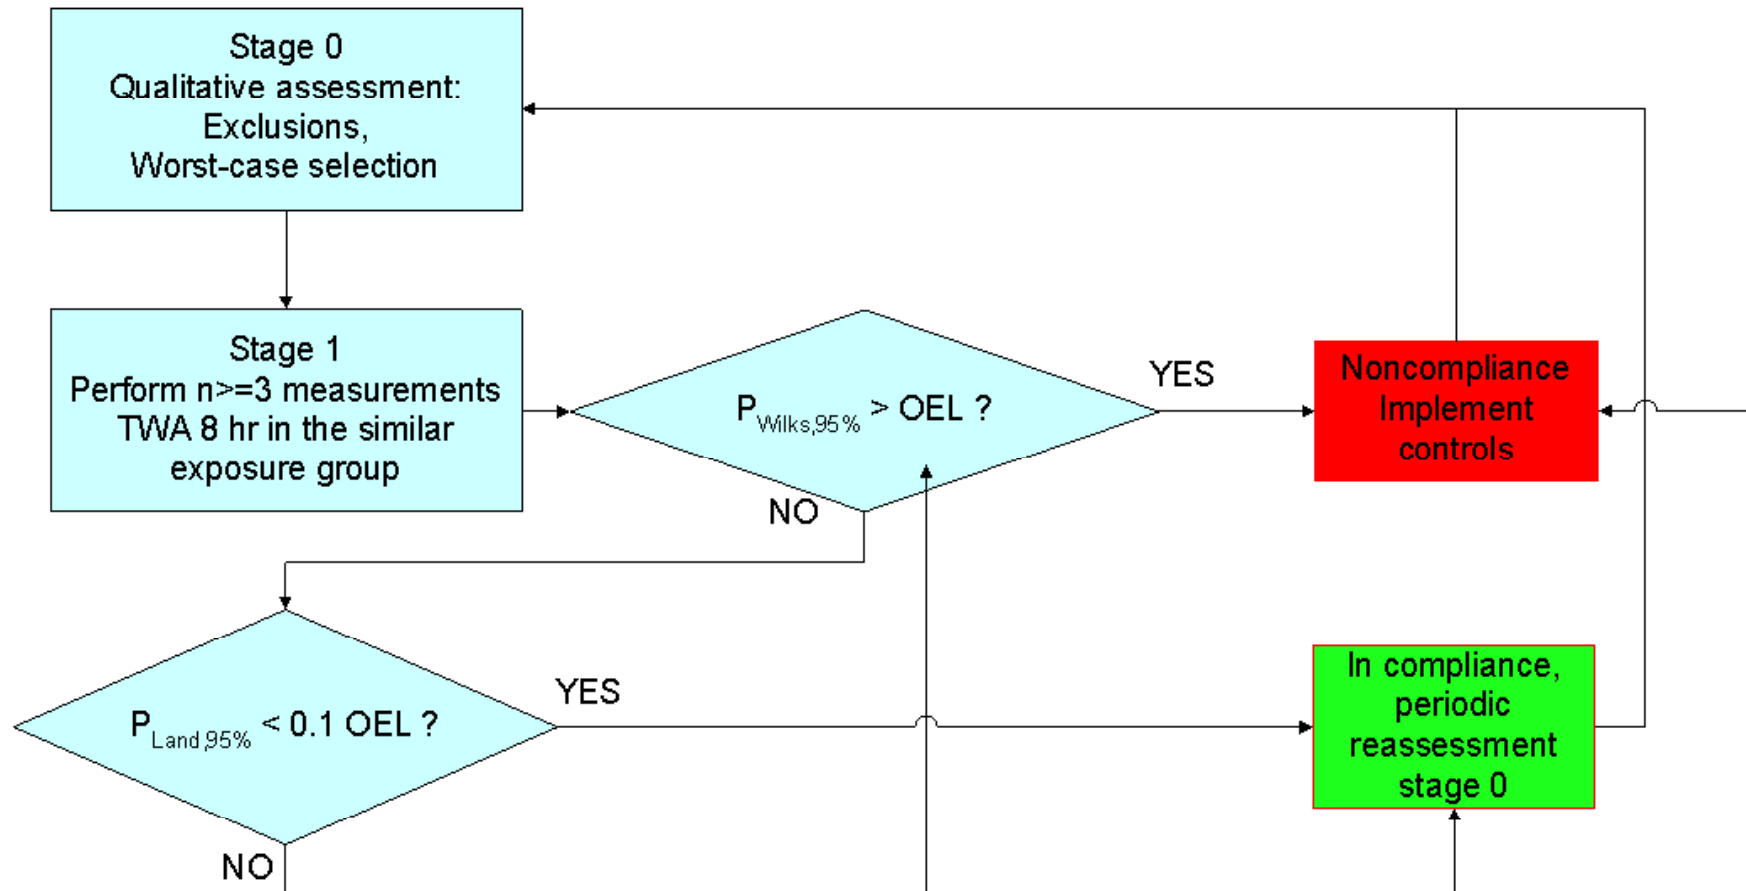

Since:

- $Z_1 = ( \log(OEL) - M ) / s$
- $Z_2 = ( \log(OEL) - ( M + 1.645 s_w ) / s_b$
- $s > s_b$
- therefore  $Z_1 \gg Z_2$
- And noncompliance  $P(Z_1) \ll P(Z_2)$
- the individual exceedance is the more stringent test
